

# Nol Station

Ale

In 2010, Västtrafik AB began working on new stations in Ale Municipality. A total of five new stations were built in Surte, Bohus, Nödinge, Nol and Älvängen.

The commuter train stations were constructed with few distinctive elements, partly for the sake of recognition, but also to make production of the various building elements both simple and practical.

For this project, we supplied steel profiles from both SP 95000 and SP 956500, all in stainless steel.

**Door and wall partitions:** Steel profile systems SP 95000 and SP 956500

**Other:** Acid-proof stainless steel EN 1.4404 (AISI 316L)

**Built in:** 2010

**Architect:** Frenning & Sjögren Arkitekter

**Producer:** Tollor AB

## Possibilities that provide added value

Our steel profile systems are developed to meet high requirements for design, safety and energy efficiency. To optimize the selection and use of our profiles, we provide manufacturers, architects and builders with full support in the construction process. At any time, you can find advice and guidance on product choice, construction, and the latest profile technology. Our construction, preparation and calculation system - KBK, will provide you valuable support throughout the process. Contact us and we will help you!

## Details that create possibilities:

- Extra narrow and wide profiles
- Profiles adapted for module locks
- Arches, round windows and arched doors
- Finger trap gasket
- Profiles for door leaves and doorframes with grooves for weather stripping
